Berner Gloves – Still the number one choice for handling cytos

Berner remains the glove of choice for those handling cytotoxics within an aseptic environment.

Thicker than standard latex gloves, Berner Gloves reduce the incidence of tearing on the collars of isolators and cabinets, whilst offering extended breakthrough times for cytotoxic agents.

The gloves fully comply with European standards EN374 chemical and bacteriological, and EN388 mechanical standards. Full breakthrough data for a range of cytotoxics including carmustine, cisplatin and methotrexate together with other technical support information is available on request.

Fully traceable, the CE marked, powder free Berner Gloves are aseptically presented in pairs in a clean peel pouch, ideal for aseptic areas.
